US-09-800-909-2\_COPY\_163\_185 134 1 PCAPGTFSNTTSSTDICRPHQIC 23 Title: Perfect score:

Sequence:

93435 seqs, 34255486 residues Searched:

BLOSUM62 Gapop 10.0 , Gapext 0.5

Scoring table:

1257 Total number of hits satisfying chosen parameters:

Minimum DB seq length: 0 Maximum DB seq length: 23

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

SwissProt\_39:\* Database : Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    "Isolation and identification of paralytic peptides from hemolymph of the lepidopteran insects Manduca sexta, Spodoptera exigua, and Heliothis Virescens."
J. Biol. Chem. 266:12873
-!- FUNCTION: CAUSES RAPID, RIGID PARALYSIS WHEN INJECTED INTO LEPIDOPTERAN LARVAE. THE PHYSIOLOGICAL ROLE MAY BE TO REDUCE HEMOLYMPH LOSS FOLLOWING INJURY AND PROMOTE WOUND HEALING.
-!- SIMILARITY: BELONGS TO THE GBP / PSP1 / PARALYTIC PEPTIDE FAMILY.
PIR, D39855; D39855.
                                                                                                                                                                                                                                                                                                                                                                                      Peptides 20:53-61(1999).
-!- FUNCTION: HAS EXCITATORY EFFECTS ON A SEMI-ISOLATED HEART FROM LARVAL MANDUCA SEXTA, CAUSING AN INOTROPIC EFFECT AT LOW CONCENTRATIONS OF PEPTIDE AND CHRONOTROPIC AND INOTROPIC EFFECTS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SIMILARITY: BELONGS TO THE GBP / PSP1 / PARALYTIC PEPTIDE FAMILY ULFID 7 19 BY SIMILARITY.

-I-FUNCTION: CAUGES RAPID, RIGID PARALYSIS WHEN INJECTED INTO LEPIDOPTERAN LARVAE. THE PHYSIOLOGICAL ROLE MAY BE TO REDUCE HEMOLYMPH LOSS FOLLOWING INJURY AND PROMOTE WOUND HEALING.
-I-SIMILARITY: BELONGS TO THE GBP / PSP1 / PARALYTIC PEPTIDE FAMILY.

                                                                                                                                                                                                  The invention relates to the diagnosis and management of infections by chlamydia species. The invention provides a composition that comprises at least two agents, where each of the agents is effective against a different phase of the chlamydial life cycle. The agents are selected from: (a) agents targetted against cryptic phase of chlamydial life cycle; (b) agents targetted against replicating phase of chlamydial life cycle; (c) agents targetted against replicating phase of chlamydial life cycle; (d) probenicid, and (e) antiporphyric acid. The composition is used to elicit a protective immune response to Chlamydia infection in an animal or human and is applied until the animal or human tests negative for Chlamydia infection. It is also used to treat biological material infected with Chlamydial phase, are used to diagnose disease, against recombinant major outer membrane protein (MOMP), and for DNA, amplification assays for chlamydial genes, are used to diagnose disease, e.g. autoimmune disease, an inflammatory disease or a disease that corcurs in an immuno-compromised individual, associated with Chlamydia infection. The kits are used to adetect chlamydial elementary bodies in a patient. The treatment reduces the accellular load of infectious Ebstein Barr virus. The method is also used to treat porphyria, by reducing the number of elementary bodies and applying a drug, e.g. cimetidine, and antioxidants, to reduce the adverse effects associated with porphyria. Sequences AMM95323 represent constant and cimetidine, are decomed and applying a species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

This invention describes a novel method to manufacture a preparation of an active substance, where the active substance is surrounded by at least one layer consisting of a protein that is cross-linked by an enzyme chosen from the group of lipoxygenase, protein disulfide isomerase, phenol oxidase and peroxidase, lysyl oxidase, protein disulfide reductase, tyrosine oxidase or sulfhydryl oxidases. Enzymes chosen from lipoxygenase, protein disulfide isomerase, phenol oxidase and peroxidase, protein disulfide reductase, tyrosine oxidase or sulfhydryl oxidase, protein disulfide reductase, tyrosine oxidase or sulfhydryl oxidase, especially lysyl oxidase are useful for formulation of preparations of active substances. The method of the invention is used for manufacturing preparations of active substances. The preparations are useful as food additives or fodder or as paramaceuticals. AAYS1961-Y31962 represent fragments of the Pichia formatics lysyl oxidase which are used to illustrate the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Lysyl oxidase; lipoxygenase; protein disulfide isomerase; phenol oxidase; peroxidase; protein disulfide reductase; tyrosine oxidase; food; sulfhydryl oxidase; animal feed.
                                                                                                                           Manufacture of active preparations comprises cross linking a protein, which surrounds the active substance with an enzyme, especially a novel lysyl oxidase from Pichia pastoris
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

This sequence is encoded by a cDNA of the invention, designated Gene No. 20. This sequence represents a human secreted protein, and is expressed ubiquitously, including T-cells and amygdala. The DNA sequences of the invention and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Also pathological conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Secreted protein; human; protein therapy; gene therapy; blood disorder; pathological condition; diagnosis; cancer; neurological disorder; developmental abnormality; foetal deficiency; leukaemia; hepatic disease; immune system disorder; Alzhahmer's disease; cognitive disorder; schizophrenia; prostate disease; autoimmune disorder; AIDS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to peptides AAB51512 - AAB51537 which represent conserved proteobacterial extracellular domains. Sequences AAB51618 represent peptides homologous to YadA, a yersinia adhesin which is an important virulence determinant of the Yersinia species. The invention includes an antibody which binds to the proteobacterial extracellular peptides, and an immunogenic composition containing the antibody used as a vaccine to prevent infection by a proteobacteria. The polypeptides and antibodies are useful in the treatment and prevention of proteobacterial infections. The polypeptides can also be used to identify compounds which antagonize the binding of a bacterial adhesion to its ligand. The host cell can be used to produce
                                                                       This invention describes a novel method where an enzyme (I) selected from lipoxygenases, protein disulfide isomerases, phenol oxidases and peroxidases, lysyl oxidases, protein disulfide reductases, tyrosine oxidases or sulfinydryl oxidases is used to formulate compositions containing active ingredients. (I) is useful for crosslinking protein layers surrounding active ingredients in food, animal feed and pharmaceutical products. The compositions can be formulated without using chemical crosslinking agents. AA$51963-Y51974 represent fragments of the Pichia pastoris lysyl oxidase protein which is used to
                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      An isolated polypeptide conserved in proteobacterial extracellular domains used in the treatment and prevention of bacterial infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Proteobacteria; extracellular domain; virulence determinant; YadA;

can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the DNA sequences. Specific uses are described for each of the DNA sequences and the encoded proteins, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurological disorders, developmental abnormalithes and foetal deficiencies, blood disorders, leukaemias, diseases of the immune system (including allergies or asthma), hepatic disease, Alzheimer's and cognitive disorders, schizophrenia, prostate diseases, autoimmune disorders and AIDS. The polypeptides are also useful for identifying their binding partners.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an immunogenic peptide derived from hepatitis B surface antigen (HBSAg) which competes with the hepatitis B surface antigen/annexin V interaction or which binds a compound or antibody competing with the hepatitis B surface antigen/annexin V interaction. Also claimed are: (1) a combination of the immunogenic peptide and a negatively charged phospholipid; (2) a peptide composition comprising the immunogenic peptide; (3) a vaccine comprising the immunogenic peptide (4) antibodies which specifically bind to the peptide and inhibit binding of HBSAg to annexin V, and (5) a therapeutic composition comprising as an active substance the antibodies of (4).

The vaccine of (3), and the therapeutic composition of (5), can be used as an inexculum to vaccinate humans against an infection with hepatitis
                                                                                                                                                                                                                                                                                                        Gaps

B and/or hepatitis delta virus. The immunogenic peptide can be used in method to detect antibodies which are capable of competing with the hepatitis B and/or hepatitis Delta virus surface antigen/annexin V interaction. The immunogenic peptide can also be used to screen for drugs which block the binding between annexin V and the peptide, and as a therapeutic to treat humans infected with hepatitis B virus and/or hepatitis Delta virus. The present sequence represents one of the peptide fragments derived from HBsAg which were synthesised to map the annexin V-binding site on HBsAg.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Detecting Adenomatous Polyposis Coli (APC) protein in a sample for diagnosing cancers, involves contacting the sample with antibodies that specifically bind to APC protein and detecting the complex formed -

contacting the sample with antibodies which specifically binds to the 2843 amino acid form of the human APC protein, or to a mutant APC protein, and detecting an APC-antibody complex. Mutations in the APC gene play a role in tumorigenesis, indicating that it is a tumour suppressor gene. It is located on chromosome 5q21, which corresponds to the FAP (familial adenomatous polyposis) locus. FAP is an autosomal dominant inherited disease in which affected individuals develop hundreds to thousands of adenomatous polyps in the colon and rectum, some of which progress to malignancy. The FAP locus is often found to be deleted in sporadic (i.e., non-familial) adenomas and carcinomas, and chromosome 5g deletions have also been observed in tumours of the lung, breast, colon, rectum, bladder, liver, sarcomas, stomach, and prostate, and in leukaemias and lymphomas. Although the FAP locus contains are several other genes such as FER, TB1, TB2, and MCC, it is thought that mutations in the APC gene play a key role in the development of FAP and sporadic tumours. The method is useful for detecting APC protein and its mutations in fortal tissue, placental tissue, amniquic fluid, blood, serum or a timour sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ij
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 diabetes mellitus type II; microtubule associated protein; Tau; Big Tau; ubiquitin B; apolipoprotein E; MAP2; neurofilament-L; neurofilament-F; presentlin I; presentlin II; cellular tumour antigen; glial fibrillary acidic protein; GRAP; p53; semaphorin III; HUPF-I; bcl-2; B-cell leukemia/lymphoma 2 proto-oncogene; HMGP-C; NSP-A; high mobility group protein-C; neuroendocrine specific protein A.
                                                                                                                                                                                                                                                                                                                                                                      serum or a tumour sample. The method is useful for diagnosing or prognosing neoplastic tissue, for detecting a genetic predisposition to cancer, for detecting germline and somatic alteration of wild-type APC genes, and for testing therapeutic agents for the ability to suppress tumours. Sequences AAB23016-B23022 represent seven 20 amino acid repeats
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       frameshift mutation, age-related disease, neurodegenerative disorder, Alzheimer's disease, Down's syndrome, myotonic dystrophy; neuronal, Huntington's disease; multiple sclerosis; alcoholic liver disease;

```
This invention describes a novel method for the diagnosis of a disease caused by, or associated with, an RNA molecule that has a frameshift mutation. The method is used to diagnose age-related diseases, especially cancer and a wide range of neurodegenerative disorders (e.g. Alzheimer's disease, Down's syndrome, myotonic dystrophy, Huntington's disease, all disease, Down's syndrome, myotonic dystrophy, Huntington's disease, and littles typer II and many others listed) or susceptibility to these disorders. The method allows a definitive diagnosis of Alzheimer's disease in living patients, at an early stage. It is based on the observation that disease may be caused by mutations in RNA rather than DNA. The invention describes the used of neuronal system RNA molecules, specifically proteins including beta-mayloid precursor protein (beta-APP), the microtubule associated protein 2 (MAP2), neurofilament-t, neurofilament-M, neurofilament-F, presentlin I, presentlin II, glial fibrillary acidic protein (GFAP), the cellular tumour antigen p53, B-cell leukemia/lymphoma 2 (bcl-2) protein (GFAP), the cellular tumour antigen p53, B-cell leukemia/lymphoma 2 (bcl-2) protein (CHMSP-C) and neuroendocrine specific protein A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                      Diagnosing disease by detecting frameshift mutations in RNA or corresponding protein mutations - used to diagnose cancer and neurological diseases, particularly Alzheimer's disease, and also for treatment and prevention with specific ribozymes or wild-type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Delgado Boada JM, Campana HR, Curbelo DM, Jimenez ER;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ð
                                                                                                                                                                                                                        ö
                                                                 The N-terminal region of P. minioluteum dextranase was sequenced using the Edman degradation method. Dextranase may be secreted as a recombinant protein by the transformed host, Pichia pastoris. The recombinant enzyme has higher thermal stability than the natural P. minioluteum enzyme (specifically an optimum temp. of 55-60 deg and a half-life of 7.6 hr at 50 deg), and it can be used in the sugar industry for sugarcane juice dextran hydrolysis.
                                                                                                                                                                                                                        Gaps

                                      The invention provides a human migration stimulatory factor (MSF) protein. Host cells containing a replicable vector comprising the MSF encoding nucleic acid can be used for the recombinant production of the protein. The polypeptide can be used for modulating cell migration, healing a wound and for preventing scarring. Sequences AAY28912-913 represent peptide epitopes of MSF against which monoclonal antibodies

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            and monoclonal antibodies. Antibodies raised against the ATM protein detected mono-specifically a high molecular weight of the expected size of 350 kDa on Western blots of protein lysates derived from fibroblast and lympho- blastcid cell lines. Because derived from fibroblast truncation mutations in the ATM gene, mutated ATM protein can be identified if such proteins are stable. Mutations in the ATM gene cause ataxia- telangiectasia (A-T), a progressive genetic disorder affecting the central nervous and immune systems. The ATM gene, located at chromosome ilga22.33, is probably involved in a novel signal transduction system that links DNA damage surveince to cell cycle control. The ATM gene product (AAW07655) has a highly conserved C-terminal region showing hinases. A-T mutations affect a variety of tissues and lead to cancer predisposition. Identification of A-T carriers, by analysis at nucleic acid or protein levels, allows better supervision and treatment of such subjects who are at increased risk of developing cancer and are particularly sensitive to radiation. The transgence animals and transformed cells are useful as models of the human disease. Also viral

                                                                                                                                                                                                                                                                                                            non-naturally occurring pharmacuetically active peptides. These novel peptides specifically bind to undetermined and determined targets in various organs and in lymphocytes. The peptides can be used in compositions, where they can be linked to pharmaceutical agents, to treat various diseases and conditions. The peptides or chimeric polypeptides or comprising these pharmaceutically active peptides and a second peptide may be labelled with a marker (radioactive isotope, etc) to form an imaging agent. This agent is used to bind an organ so that the organ can

This invention describes novel non-naturally occurring pharmaceutically active peptide epitopes (1) comprising the tripeptide, Glu-Gly-Arg. (1) are useful for binding to endothelial call and tumor cells/fissues, and are also useful for imaging an organ, preferably an artery (umbilical cord artery, radial artery, coronary artery or mammary artery), a vein (umbilical cord vein, safenal vein or femoral vein), placenta, tumor tissue, kidney, heart or liver. The artery is preferably damaged, and is a coronary artery rhey are also useful for treating an organ in vivo, preferably an artery (umbilical cord artery, radial artery, coronary artery or an enamary artery, preferably a damaged coronary artery (umbilical cord artery, radial artery, coronary artery, inclinated ord artery or a mammary artery, preferably a damaged coronary artery, wein tissue, kidney, heart, liver, or central nervous system. AAY33123-Y33132 represent epitopes described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                       peptides useful for directing therapeutics to cancer tissues - and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 4

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                          RESULT 3
S68261

Whypothetical protein gadd7.2 - long-tailed hamster
C;Species: Cricetulus longicaudatus (long-tailed hamster)
C;Date: 06-Dec-1996 #sequence_revision 13-Mar-1997 #text_change 17-Mar-1999
C;Accession: S68261
R;Hollander, M.C.; Alamo, I.; Fornace Jr., A.J.
Nucleic Acids Res. 24, 1589-1593, 1996
A;Title: A novel DNA damage-inducible transcript, gadd7, inhibits cell growth, but lacks A;Reference number: S68260; MuID:96211359
A;Accession: S68261
A;Accession: S68261
A;Accession: Dreliminary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A; Molecule type: protein
A; Residues: 1-39 <SOS>
C; Comment: Phospholipases A2 catalyze the calcium-dependent hydrolysis of the 2-acyl grc
C; Superfamily: phospholipase A2
C; Keywords: calcium; carboxylic ester hydrolase; lipid degradation; venom
                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

phospholipase A2 (EC 3.1.1.4) - Mexican beaded lizard (fragment)
N.Alternate names: phosphatidylcholine 2-acylhydrolase
N.Alternate names: phosphatidylcholine 2-acylhydrolase
C.Specises: Heloderma horridum (Mexican beaded lizard)
C.Specises: Heloderma horridum (Mexican beaded lizard)
C.Saccession: A05333
S. Accession: A05333
Blochemistry 25, 2927-2933, 1986
A.Reference number: A05323; MUID:86243292
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RESULT 5
